## 2024\_28\_III\_OOPS Using Java Lab

### 2028\_REC\_OOPS using Java\_Week 8\_Q1

Attempt : 1  
Total Mark : 10  
Marks Obtained : 10

#### Section 1 : Coding

##### 1. Problem Statement

Write a program to validate the email address and display suitable exceptions if there is any mistake.

Create 3 custom exception classes as below

DotException AtTheRateException DomainException

A typical email address should have a "." character, and a "@" character, and also the domain name should be valid. Valid domain names for practice be 'in', 'com', 'net', or 'biz'.

Display Invalid Dot usage, Invalid @ usage, or Invalid Domain message based on email id.

Get the email address from the user, validate the email by checking the

above-mentioned criteria, and print the validity status of the input email address.

### ***Input Format***

The first line of input contains the email to be validated.

### ***Output Format***

The output prints a Valid email address or an Invalid email address along with the suitable exception

If email ends with . or contains not exactly one . after @, it throws:

DotException: Invalid Dot usage

Invalid email address

If @ appears not exactly once, it throws:

AtTheRateException: Invalid @ usage

Invalid email address

If the part after the last dot is not among accepted domains:

DomainException: Invalid Domain

Invalid email address

If all conditions satisfied then print:

Valid email address

Refer to the sample input and output for format specifications.

### **Sample Test Case**

Input: sample@gmail.com

Output: Valid email address

### **Answer**

```
// You are using Java
import java.util.Scanner;
class DotException extends Exception {
    public DotException(String message) {
        super(message);
    }
}
class AtTheRateException extends Exception {
    public AtTheRateException(String message) {
        super(message);
    }
}
class DomainException extends Exception {
    public DomainException(String message) {
        super(message);
    }
}
public class Main {
    public static void validateEmail(String email) throws DotException,
    AtTheRateException, DomainException {
        int atCount = email.length() - email.replace("@", "").length();
        if (atCount != 1) {
            throw new AtTheRateException("AtTheRateException: Invalid @ usage");
        }
        if (email.endsWith(".")) {
            throw new DotException("DotException: Invalid Dot usage");
        }
        int indexAt = email.indexOf('@');
        String domainPart = email.substring(indexAt + 1);
        int dotCountAfterAt = domainPart.length() - domainPart.replace(".",
        "").length();
        if (dotCountAfterAt != 1) {
```

```

        throw new DotException("DotException: Invalid Dot usage");
    }
    int lastDotIndex = email.lastIndexOf('.');
    String domain = email.substring(lastDotIndex + 1);
    if (!(domain.equals("in") || domain.equals("com") || domain.equals("net") ||
domain.equals("biz"))) {
        throw new DomainException("DomainException: Invalid Domain");
    }
}
public static void main(String[] args) {
    Scanner sc = new Scanner(System.in);
    String email = sc.nextLine();
    try {
        validateEmail(email);
        System.out.println("Valid email address");
    } catch (DotException | AtTheRateException | DomainException e) {
        System.out.println(e.getMessage());
        System.out.println("Invalid email address");
    }
    sc.close();
}
}

```

**Status :** Correct

**Marks :** 10/10
